4	Asset quality	10

Commentary

Lending to the non-banking sector in November of last year was still up significantly in year-on-year terms, although the monthly increase in the stock of loans was smaller than in the previous months of 2022 amid weaker current lending to non-financial corporations and households. Interest rates on new loans to the non-banking sector rose discernibly in the second half of the year, and deposit rates also rose slightly. Deposits by non-financial corporations have been strengthening since the halfway point of last year, but household deposits also increased again in November after several months of decline. The asset quality indicators point to a certain deterioration over the last two months. Net income in the banking system over the first eleven months of the year was up a fifth on the same period of the previous year. Year-on-year growth in net interest continued to strengthen, and the net interest margin continued to rise, while non-interest income also remained higher than in the previous year. With net impairments and provisions remaining very low, pre-tax profit remains comparable to the previous year.

After one year of decline, year-on-year growth in the balance sheet total has been strengthening since July, and reached 5.5% in November of last year. The balance sheet total increased by EUR 367 million in November. Amid a large inflow of deposits by the non-banking sector and issuance of debt securities, November saw a pronounced increase in the banks' holdings of liquid assets in accounts at the central bank (by EUR 352 million), while a smaller portion of the funding obtained was directed into lending. November's increase in loans to households and non-financial corporations was smaller than the monthly average over the first ten months of the year.

Year-on-year growth in loans to the non-banking sector remained high in November at 12.0%, while interest rates rose notably during the second half of the year. The monthly increase of EUR 147 million in the stock of loans was significantly smaller than the average over the previous ten months (EUR 266 million), and was driven primarily by loans to non-financial corporations and non-residents. Similarly to October, lending to non-financial corporations was again concentrated among just a few large enterprises. Current lending to households continued to decline. The monthly increase of EUR 38 million in the stock of household loans was significantly smaller than the average over the previous ten months, with housing loans accounting for the majority. The volume of new housing loans has nevertheless declined sharply in recent months. The year-on-year increase in the stock of housing loans thus slowed to 10.5%, but remained among the highest in the euro area. Consumer loans accounted for EUR 6.4 million of November's monthly increase in household loans, taking their year-on-year growth to 0.4%, the first positive rate in two and a half years. The rise in interest rates on loans to the non-banking sector continued in November. Interest rates rose significantly in the second half of last year on loans to non-financial corporations and on household loans. Average interest rates on new fixedrate loans to non-financial corporations rose by 3.0 percentage points over the first eleven months of last year, while average variable interest rates rose by 1.5 percentage points. Fixed and variable interest rates on housing loans rose by 1.7 percentage points and 1.9 percentage points respectively, while the equivalent figures for consumer loans were 0.6 percentage points and 1.5 percentage points.

October's discernible deterioration in the asset quality of certain parts of the portfolio spread across more sectors in the non-financial corporations portfolio in November, but the overall NPE ratio remained low (at 1.2%). The NPE ratio has risen significantly over the last two months in accommodation and food service activities (by 0.8 percentage points) and in professional, scientific and technical activities (0.6 percentage points), and has seen smaller increases in wholesale and retail trade (0.3 percentage points) and in certain other sectors. These increases were reflected in the overall non-financial corporations sector in an increase in the

stock of NPEs, while the NPE ratio in the portfolio remained at the October level of 1.9%. The share of Stage 2 exposures similarly increased in November in numerous sectors within the non-financial corporations portfolio. Manufacturing saw the largest increases in Stage 2 exposures in terms of both share and stock, which raised the share of Stage 2 exposures in the overall non-financial corporations portfolio to 8.0%, up 0.4 percentage points on October. A deterioration in asset quality according to this indicator was also seen for the second consecutive month in the household loans portfolio, particularly the consumer loans portfolio, although it was also evident (in November alone) in the housing loans portfolio. The share of Stage 2 exposures in the total portfolio increased merely by 0.1 percentage points to 4.7%. Coverage of NPEs by impairments and provisions declined by 4.6 percentage points between June and November to reach 55.6%, down on its value at the end of 2021 of 57.1%. The largest factor in the decline in coverage was the decline in coverage of NPEs to non-residents. Coverage of NPEs in other portfolio segments remained higher in November than at the end of 2021, despite its decline in recent months.

Amid a large inflow of household deposits and deposits by non-financial corporations, year-on-year growth in deposits by the non-banking sector has been strengthening since April of last year, and reached 7.9%. After three consecutive months of decline, the stock of household deposits increased by EUR 120 million in November to EUR 25.2 billion, taking the year-on-year rate of growth to 6.1%. Although non-financial corporations sharply increased their holdings of bank savings (by EUR 242 million) in November, similarly to the four previous months, the total increase over the first eleven months of the year of EUR 440 million was merely just over a third of the increase in household deposits over the same period. Year-on-year growth in deposits by non-financial corporations has been picking up pace sharply since June, and reached 11.6% in November, thanks in part to their more modest saving in the previous year.

Gross and net income in the banking system over the first eleven months of last year were up on the same period of the previous year, by 11.5% and 20.7% respectively. The trend of rapid increase in net interest has continued: the year-on-year rate of growth has more than doubled over the last three months, reaching 15.8% in November. Year-on-year growth in net non-interest income and in net fees and commission slowed to 6.6% and 6.3% respectively. The net interest margin is rising rapidly, and reached 1.55% in November, up 0.16 percentage points on its lowest point in April of last year. Quantity effects are increasingly being joined by favourable price effects, particularly since the summer, as a result of rising interest rates. Further positive effects come from the modest increase in interest expenses, as a result of the high share of sight deposits and the virtually unchanged interest rates on fixed-term deposits by the non-banking sector. Growth in operating costs (a year-on-year rate of 5.5%) was comparable to growth in the balance sheet total, and was merely half of the rate of growth in gross income.

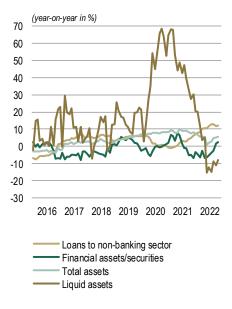

Pre-tax profit amounted to EUR 477 million over the first eleven months of last year, similar to the same period of the previous year. The banks again saw the net creation of impairments and provisions over this period (in contrast to a net release in the previous year). The net creation of impairments and provisions nevertheless remains low, and at EUR 30 million accounted for just 2.5% of the disposal of gross income. Pre-tax ROE stood at 10.5% over the first eleven months of the year, unchanged in year-on-year terms.

The banking system's capital position remained sound, and liquidity remained good. The total capital ratio at the consolidated level declined to 17.0% in the third quarter of last year, slightly less than the euro area average, while the CET1 ratio remains above the euro area average despite declining to 15.5%. After declining in the first quarter of last year, the liquidity coverage ratio (LCR) remained relatively stable over the remaining months of the year. It stood at 282% in November, down 30 percentage points on the end of the previous year, but still well above the regulatory requirement (of 100%). The decline in the LCR over the first eleven months of last year was mainly attributable to a decline in holdings of liquid assets in accounts at the central bank and a simultaneous increase in net liquidity outflows.

Notes: * Loans to non-banking sector not held for trading based on "Methodology for compiling the recapitulation of the statement of financial position" comprise loans and other financial assets at amortised cost (from A.VI), at fair value (FV) through P&L (from A.III), and at FV through other comprehensive income (from A.IV).

^{**} Financial assets / securities on the asset side comprise total financial assets from A.II, including loans held for trading, while equities and debt securities other than loans are captured from other categories of financial asset (A.III, A.IV and A.V).

^{***}Total financial liabilities measured at amortized cost in 2008 also include banks' liabilities to the central bank.

^{*****} Includes subordinated debt until 31 December 2017. Under the IFRS 9 methodology, the item of "subordinated debt" is abolished, and these liabilities are included under liabilities to banks.

The bank performance data in this publication is based on the banks' own book figures, which differ in methodological terms from the published statistics. The data on loans also differs because the data in this publication includes loans to non-residents, applies the net principle (amounts are minus value adjustments), and does not include non-marketable securities.
